Chamomile, German

*Matricaria recutita* L. (syn. *Chamomilla recutita* [L.] Rauschert; *M. chamomilla* L.; *M. suaveolens* L.)

[Fam. *Asteraceae*]

**OVERVIEW**

Chamomile is one of the most widely used ingredients in herbal teas worldwide. The amount of chamomile imported into the U.S. each year is between 750,000 and one million pounds, with an estimated 90% used in teas. In the U.S. and Europe, chamomile is also a popular ingredient for external use in health and beauty aids. In commerce, chamomile is often called German chamomile or Hungarian chamomile, which should not be confused with the rarer, and more costly, Roman or English chamomile (*Anthemis nobilis* syn. *Chamaemelum nobile*).

**PRIMARY USES**

**Internal**
- Gastrointestinal spasms
- Inflammatory diseases of the gastrointestinal tract
- Indigestion, flatulence, and/or excess gas production, bloating

**External**
- Inflammatory dermatosis
- Neurodermatitis
- Wound treatment after dermabrasion for tattoo removal
- Ano-genital inflammation (baths and irrigation)

**OTHER POTENTIAL USES**
- Diarrhea in children
- Common cold symptoms
- Alleviation of mucositis induced by radiation and chemotherapy

**PHARMACOLOGICAL ACTIONS**

Anti-inflammatory; muscle relaxant; antispasmodic; promotes wound-healing; deodorant; antibacterial and bacteriostatic; stimulates skin metabolism; mild sedative; carminative.

**DOSAGE AND ADMINISTRATION**

**Internal and External**

Caution patients to report any acute complaints that last more than one week, or recur periodically.

**Internal**
- **DRIED FLOWER HEADS**: 2–4 g, 3 times daily; 5 g single dose.
- **INFUSION**: The German Commission E dosage: 150 ml boiling water poured over approximately 3 g dried flower and steeped, covered, for 5–10 minutes, 3–4 times daily between meals for gastrointestinal complaints. The official Swiss tea infusion dosage for the same indication is 900 mg, 3–5 times daily.
- **FLUID EXTRACT**: 1:1 (g/ml), 38–53% ethanol (v/v), containing minimum 0.3% (m/m) blue volatile oil, 1–4 ml, 3 times daily.
- **TINCTURE**: 1:5 (g/ml), 45% ethanol, 3–10 ml, 3 times daily. The Kamillosan® Konzentrat product has an approximately 1:4.0–4.5 (w/v) ratio in 42.8% ethanol; each 100 ml contains 150–300 mg essential oil, 150–300 mg apigenin-7-glucoside, and 50 mg (-)-α-bisabolol. Adults: 5 ml in 100 ml warm water, 4 times daily. Children: 2.5 ml, 4 times daily.

**External**
- **BATH ADDITIVE**: 50 g dried flower added to 10 liters (about 2.5 gallons) water, as a bath for ano-genital inflammation.
- **GARGLE**: 100 ml boiling water poured over 3–10 g dried flower and steeped, covered, for 5–10 minutes. The tea infusion used as a wash or gargle for inflammation of the mucous membranes of the mouth and throat. Or, 5 ml tincture poured into 100 ml warm water and gargled 3 or more times daily.
- **INHALATION**: 100 ml boiling water poured over 3–10 g dried flower and steeped, covered, for 5–10 minutes. Or, 15 ml tincture poured into 0.5 liter boiled water, 1–3 times daily. Steam vapor inhaled for inflammation of the upper respiratory tract.
- **POULTICE**: Semisolid paste or plaster containing 3–10% (m/m) of flower heads.
- **RINSE**: Hot aqueous rinse containing 3–10% infusion.

**NOTE**: Do not apply the infusion near the eyes.

*Chamomile, German* 
Photo © 2003 stevenfoster.com
**CONTRAINDICATIONS**

Known hypersensitivity to plants of the *Asteraceae (Compositae)* family such as arnica flower (*Arnica* spp.), chamomile flower (*Matricaria* spp.), marigold flower (*Calendula officinalis*), and yarrow flower (*Achillea* spp.); ragweed (*Ambrosia* spp.); asters (*Aster tataricus*); and chrysanthemums (*Chrysanthemum* spp.).

**PREGNANCY AND LACTATION:** No known restrictions.

**ADVERSE EFFECTS**

Minor side effects have been recorded. In rare cases, a contact allergy may occur. Washing the eyes with chamomile tea may cause allergic conjunctivitis in rare cases. The highly concentrated hot tea has been reported to act as an emetic. The unprocessed, crude flower is free from any toxic effects. Rarely, anaphylactic reactions can occur. Case reports have documented contact dermatitis and urticaria as well as one fatal anaphylaxis after a chamomile-containing enema was given during labor.

**DRUG INTERACTIONS**

No known interactions. Fluid extract may prevent ethyl alcohol-induced ulcer formation. Potential interactions with warfarin have been cautioned.

**CLINICAL REVIEW**

Of 10 clinical studies on German chamomile extract (8,668 total participants), all but 1 demonstrated positive effects for indications including dermatological, neurological, and respiratory conditions. Three studies focused on the use of chamomile as a mouthwash for stomatitis and for its astringent and cooling effects. One stomatitis study did not notice significant improvement. Dermatological studies included a controlled, bilateral, comparative study investigating a chamomile cream against inflammatory dermatoses, and a double-blind (DB) study on use of a chamomile extract to promote wound-healing after dermabrasion. Other studies demonstrating positive results included inhalation of the steam vapor of chamomile extract to treat respiratory tract conditions related to the common cold, inhalation of the volatile oil to determine the effect of olfactory stimulation on mood, and oral ingestion of the aqueous infusion to investigate cardiac effects after ventricular catheterization. In a study of 8,058 mothers in childbirth conducted over a period of eight years, two essential oils, clary sage (*Salvia sclarea*) and chamomile, were shown to be effective in alleviating pain during labor. A recent DB, placebo-controlled study investigated the use of a chamomile fluid extract and apple pectin combination product for treating young children with acute, non-complicated diarrhea.
Chamomile, German

*Matricaria recutita* L. (syn. *M. recutita* L. Rauschert; *M. chamomilla* L.; *M. suaveolens* L.)  
[Fam. *Asteraceae*]

**Overview**
In the U.S., chamomile is one of the most widely used herbal ingredients in teas as well as in cosmetic, health, and beauty aid products. The amount of chamomile imported into the U.S. each year is between 750,000 and one million pounds, with an estimated 90% used in teas. In commerce, chamomile is often called German chamomile or Hungarian chamomile, which should not be confused with the rare, and more costly, Roman or English chamomile (*Anthemis nobilis* syn. *Chamaemelum nobile*).

**Uses**

**Internal**
Indigestion; flatulence (gas); bloating; gastrointestinal spasms; inflammatory diseases of the gastrointestinal tract.

**External**
Inflammatory skin conditions; scaly patches of skin resulting from an itch that is irritated when scratched; wound treatment after dermabrasion for tattoo removal; inflamed anal and genital areas (baths and irrigation).

**Dosage**
For acute complaints that last more than one week, or recur periodically, consult your healthcare provider.

**Internal**
**Fluid Extract:** 1–4 ml, 3 times daily.
**Tincture:** Adults: 5 ml in 100 ml warm water, 4 times daily. Children: 2.5 ml, 4 times daily.

**External**
**Bath Additive:** Add 50 g dried flower per 10 liters (approximately 2.5 gallons) water. Bathe in the infusion for ano-genital inflammation.
**Gargle:** Pour 100 ml boiling water over 3–10 g dried flower and steep, covered, for 5–10 minutes. Use the tea infusion as a wash or gargle for inflammation of the mucous membranes of the mouth and throat, or pour 5 ml tincture into 100 ml warm water, and gargle 3 or more times daily.
**Inhalation:** Pour 100 ml boiling water over 3–10 g dried flower and steep, covered, for 5–10 minutes, or pour 15 ml tincture into approximately 2 cups boiled water, 1–3 times daily. Inhale steam vapor for inflammation of the upper respiratory tract.

**Contraindications**
Individuals allergic to plants in the same family (including arnica, marigold, yarrow, chrysanthemum, and ragweed, for example) may experience a similar reaction to chamomile.

**Pregnancy and Lactation:** There are no known restrictions for usage during pregnancy or while breast-feeding.

**Adverse Effects**
Rare cases of allergic reactions to chamomile used as an eyewash have been reported. A fatal, possibly allergic, reaction occurred during labor after a chamomile enema was used. Highly concentrated hot tea may cause vomiting. Other adverse effects include dermatitis and urticaria.

**Drug Interactions**
The fluid extract may prevent ulcers caused by alcohol consumption. Potential interactions with the anticoagulating drug warfarin have been speculated.
Chamomile, German

*Matricaria recutita* L. (syn. *Chamomilla recutita* [L.] Rauschert; *M. chamomilla* L.; *M. suaveolens* L.)

[Fam. *Asteraceae*]

**OVERVIEW**

Chamomile is one of the most widely used ingredients in herbal teas worldwide. The amount of chamomile imported into the U.S. each year is between 750,000 and one million pounds, with an estimated 90% used in teas (Keating, 2001). In the U.S. and Europe, chamomile is also a popular ingredient for external use in health and beauty aids. In commerce, chamomile is often called German chamomile or Hungarian chamomile, which should not be confused with the rarer, and more costly, Roman or English chamomile (*Anthemis nobilis* syn. *Chamaemelum nobile*).

**DESCRIPTION**

Chamomile preparations consist of the fresh or dried flower heads of *Matricaria recutita* L. (syn. *Chamomilla recutita* [L.] Rauschert; *M. chamomilla* L.; *M. suaveolens* L.) [Fam. *Asteraceae*]. Pharmacopoeial grade chamomile must contain no less than 0.4% of blue volatile oil, and no less than 0.3% of apigenin-7-glucoside (USP, 2002). Pharmacopoeial grade chamomile fluid extract contains not less than 0.3% (w/w) blue residual oil with an ethanol content of 38%–53% (v/v) (Ph.Eur., 2001).

**PRIMARY USES**

**Internal**

- Gastrointestinal spasms, inflammatory diseases of the gastrointestinal tract (Morant and Ruppanner, 2001; Blumenthal *et al.*, 1998; Bradley, 1992; Braun *et al.*, 1996)
- Indigestion, flatulence and/or excess gas production, bloating (Health Canada, 1996)

**External**

- Dermatology
  - Inflammatory dermatosis and neurodermatitis (Aertgeerts *et al.*, 1985)
  - Wound treatment after dermabrasion for tattoo removal (Glowania *et al.*, 1987)
  - Ano-genital inflammation (baths and irrigation) (Blumenthal *et al.*, 1998; Braun *et al.*, 1996)

**OTHER POTENTIAL USES**

- Diarrhea in children (de la Motte *et al.*, 1997)
- Common cold symptoms (Saller *et al.*, 1990)

**ONCOLOGY**

- Alleviation of radiation and chemotherapy induced mucositis (Carl and Emrich, 1991)

**DOSEAGE**

**Internal Crude Preparations**

**DRIED FLOWER HEADS:** 2–4 g, 3 times daily (Bradley, 1992), 5 g single dose (CCRUM, 1992).

**INFUSION:** The German Commission E dosage is 150 ml boiling water poured over approximately 3 g dried flower and steeped, covered, for 5–10 minutes, 3–4 times daily between meals for gastrointestinal complaints (Blumenthal *et al.*, 1998; Braun *et al.*, 1996). The official Swiss tea infusion dosage for the same indication is 900 mg, 3–5 times daily (Morant and Ruppanner, 2001).

**FLUID EXTRACT:** 1:1 (g/ml), 38–53% ethanol (v/v), containing minimum 0.3% (w/w) blue volatile oil, 1–4 ml, 3 times daily (Bradley, 1992).

**TINCTURE:** 1:5 (g/ml), 45% ethanol, 3–10 ml, 3 times daily (Bradley, 1992).

**TINCTURE:** 1:4.0–4.5 (w/v) ratio in 42.8% ethanol. Adults: 5 ml in 100 ml warm water, 4 times daily. Children: 2.5 ml, 4 times daily (Asta Medica, 1998; Gelbe Liste Pharmindex, 2000).

**External Crude Preparations**

**BATH ADDITIVE:** 50 g dried flower added per 10 liters (ca. 2.5 gallons) water as a bath for ano-genital inflammation (Blumenthal *et al.*, 1998; Braun *et al.*, 1996).

**GARGLE:** 100 ml boiling water poured over 3–10 g dried flower and steeped, covered, for 5–10 minutes (Braun *et al.*, 1996). The tea infusion is used as a wash or gargle for inflammation of the mucous membranes of the mouth and throat (Blumenthal *et al.*, 1998; Braun *et al.*, 1996). Or 5 ml tincture poured into 100 ml warm water and gargled 3 or more times daily (Asta Medica, 1998).

**INHALATION:** 100 ml boiling water poured over 3–10 g dried flower and steeped, covered, for 5–10 min. (Braun *et al.*, 1996). Or 15 ml tincture poured into 0.5 liter boiled water, 1–3 times daily (Asta Medica, 1998). Steam vapor inhaled for inflammation of the upper respiratory tract.
POULTICE: Semisolid paste or plaster containing 3–10% (m/m) of flower heads (Blumenthal et al., 1998).
RINSE: Hot aqueous rinse containing 3–10% infusion (Blumenthal et al., 1998).
NOTE: Do not apply infusion near eyes (Braun et al., 1996).

**DURATION OF ADMINISTRATION**
**Internal and external**
For acute complaints that last more than one week, or recur periodically, consult a healthcare provider (Braun et al., 1996).

**CHEMISTRY**
Chamomile contains from 6–8% flavonoids (Hänse et al., 1999; Brunton, 1999; Dolle et al., 1985), composed of flavone glycosides including apigenin 7-glucoside and its 6'-acetylated derivative and flavonols including luteolin glucosides, quercetin glycosides, andisorhamnetin (Bruneton, 1999); up to 10% mucilage polysaccharides (Carle and Isaac, 1985; Meyer-Buchtel, 1999); 0.4–2.0% volatile oil, composed of bisabolane sesquiterpenes (up to 50%) and chamazulene (1–15%); sesquiterpene lactones (matricin and matricarin) (Bruneton, 1999; Carle and Isaac, 1985); and up to 0.3% choline (Schilcher, 1987).

**PHARMACOLOGICAL ACTIONS**
According to the German Commission E, chamomile is anti-inflammatory; muscle relaxant; antispasmodic; promotes wound-healing; deodorant; antibacterial; bacteriostatic; stimulates skin metabolism (Blumenthal et al., 1998).

**Internal Human**
Sedative (Bradley, 1992; Gould et al., 1973; Mann and Staba, 1986); carminative (CCRUM, 1992).

**Animal**
Inhibits ulceration (Szelenyi et al., 1979); relaxes smooth muscle (Carle and Gomaa, 1991,92); depresses central nervous system (CNS) (Della Loggia et al., 1982). Apigenin binds to central benzodiazepine receptors, producing anxiolytic effects in mice but without any sedative or myorelaxant effects (Viola et al., 1995). A subsequent study reports, in contrast, that apigenin has sedative action without anxiolytic and/or myorelaxant effect. The study links the sedative action of chamomile extracts not to an activation of GABA<sub>A</sub> receptors by apigenin, but to other compounds with benzodiazepine-like activity (Avallone et al., 2000).

**In vitro**
Antipeptic (reduces proteolytic activity of pepsin by 50%) (Thiemer et al., 1972; Isaac and Thiemer, 1975); prevents and relieves inflammation (Ammon and Sabieraj, 1996).

**External Human**
Anti-inflammatory (Aertgeerts et al., 1985); astringent; cooling (Nasemann, 1975); promotes wound-healing (Glowania et al., 1987).

**Animal**

**MECHANISM OF ACTION**
- Whole plant extracts of chamomile have demonstrated antispasmodic action, though the mechanism of action was unclear (Forster et al., 1980). Antispasmodic effects are due mainly to chamomile’s water-soluble constituents (Carle and Gomaa, 1991,92) such as the flavonoids apigenin and apigenin-7-O-glucoside and the volatile oil (–)-α-bisabolol, which act similarly to papaverine (Bruneton, 1999; WHO, 1999).
- Sedative effects are attributed to the flavonoids, including apigenin, which acts as a ligand for the central benzodiazepine receptors. Apigenin competitively inhibits the binding of flunitrazepam, thus providing a molecular basis for possible weak CNS-depressing activity of water-based preparations (e.g., teas) (Viola et al., 1995).
- Apigenin may be an anti-inflammatory constituent (Hadley and Petry, 1999), due to the water-soluble and lipophilic components. The flavones block the arachidonic acid pathway by inhibiting phospholipase A, cyclo-oxygenase, and lipoxygenase pathways. The volatile oil components, chamazulene and α-bisabolol, have also demonstrated anti-inflammatory action by interfering with 5-lipoxygenase and cyclo-oxygenase production (Carle and Gomaa, 1991,92).
- The azulene components of the volatile oil have anti-allergic and anti-inflammatory actions, though the mechanism of action was unclear (Farnsworth and Morgan, 1972).
- Azulene may prevent histamine discharge from tissue by activating the pituitary-adrenal system, causing the release of cortisone (Stern and Milin, 1956); or azulene may prevent allergic seizures caused by histamine release, activating cellular resistance and speeding the process of healing (Meer and Meer, 1960).
- Chamomile extract accelerates wound-healing, reportedly by reducing inflammation and promoting tissue granulation and regeneration on topical application (Carle and Isaac, 1987).

**CONTRAINDICATIONS**
Known hypersensitivity to plants of the Asteraceae (Compositae) family such as arnica flower (Arnica spp.), chamomile flower (Matricaria spp.), marigold flower (Calendula officinalis L.), and yarrow flower (Achillea spp.) (Braun et al., 1996); ragweed (Ambrosia spp.); asters (Aster tataricus L. f.); and chrysanthemums (Chrysanthemum spp.) (WHO, 1999).

**PREGNANCY AND LACTATION**: No known restrictions in pregnancy or lactation (De Smet et al., 1992; McGuffin et al., 1997). No adverse teratogenic effects have been reported in vivo (WHO, 1999).

**ADVERSE EFFECTS**
Minor side effects are recorded by several references (McGuffin et al., 1997). There is empirical evidence of extremely rare contact allergy (Bradley, 1992; Brinker, 2001). Eye washing with chamomile tea may induce allergic conjunctivitis in rare cases (Subiza et al., 1990). Highly concentrated hot tea has been reported to act as an emetic (Chadha, 1952–1988). The unprocessed crude flower is free from any toxic effects (CCRUM, 1992). Case reports describing contact dermatitis and urticaria have been documented (Foti et al., 2000; Giordano-Labadie, 2000; Rodriguez-Serna et al., 1998; Pereira, 1997; McGeorge and Steele, 1991; van Ketel, 1982). A case report regarding a fatal outcome of anaphylaxis when a chamomile-containing enema was given during labor has been documented (Jensen-Jarolim et al., 1998). Rarely, anaphylactic reactions can occur (Casterline, 1980; Subiza et al., 1989).
There have been several reports in the literature of suspected anaphylaxis associated with the use of chamomile. One authoritative source, reviewing the available literature from over almost 100 years, concluded, “This rather remote possibility may have been greatly overemphasized in the nonmedical literature. Only five cases of allergy specifically attributed to German chamomile were identified worldwide between 1887 and 1982; however, a recent report indicates that a German chamomile ether extract used in allergic patch testing from 1985 to 1990 in 3,851 tested individuals produced an allergic reaction in sixty-six patients or 1.7%.” (Robbers and Tyler, 1999). One of the reports receiving widespread attention in the medical press was based on a misinterpretation of the taxonomic identity of the so-called “chamomile” (Anon., 1979). This article warned readers to avoid teas made from the Composite family, including chamomile, goldenrod (Solidago virgaurea), marigold, and yarrow. The article cited a paper titled “Anaphylactic reaction to chamomile tea” (Benner and Lee, 1973), which does not specify the genus or species of the purported chamomile material implicated in the single case described, a 35-year-old woman who suffered from ragweed hay fever and who developed anaphylaxis following ingestion of one cup of the purported “chamomile tea” (Awang, 1990). The incident was incorrectly inferred to be the popular German or Hungarian chamomile (M. recutita). The actual case was based on ingestion of dog fennel (Anthemis cotula), a plant not widely used in commercial products, and generally unavailable in the U.S. Dog fennel is a member of the genus Anthemis, the same as Roman or English chamomile (A. nobilis, syn. Chamaemelum nobile) — hence the erroneous appellation “chamomile” by the authors of the case reports (Lewis, 1992). Dog fennel contains a higher level of anthocyanidin, a sesquiterpene lactone that has demonstrated activity in primary irritant contact dermatitis (Hausen et al., 1984).

However, there have been some recent reports of anaphylaxis to German chamomile (M. recutita). In one study, 10 out of 14 patients with a history of allergy to chamomile, spices, or “weeds” tested positive to chamomile in a skin prick/RAST test (Reider et al., 2000). Curiously, chamazulene in German chamomile has anti-allergic and anti-inflammatory activity, and another constituent, an EN-IN-dicycloether, has demonstrated anti-inflammatory, anti-anaphylactic, spasmylocytic, and bacteriostatic activity (Farnsworth and Morgan, 1972).

**Drug Interactions**

According to the German Commission E, no interactions are known (Blumenthal et al., 1998). The fluid extract may prevent ethyl alcohol-induced ulcer formation (Brinker, 2001). In vitro studies of the inhibitory effect of ethanolic herbal extracts and tinctures on the cytochrome P450 3A4 (CYP3A4) system revealed a median inhibitory concentration (IC50) of a chamomile extract ranging from 1–2%. This might have implications for predicting the likelihood of potential herb-drug interactions (Budzinski et al., 2000), although such reactions have not been reported. Potential interactions with warfarin have been reported, and caution regarding their concomitant use has been suggested (Heck et al., 2000), although this remains speculative.

**American Herbal Products Association (AHPA) Safety Rating**

Class 1: Herbs that can be safely consumed when used appropriately (McGuffin et al., 1997).

**Regulatory Status**

**Austria:** Official in the Austrian Pharmacopoeia (ÖAB) (Wichtl, 1997).

**Belgium:** Herbal medicine for oral or external use for specific indication (Bradley, 1992; Van Hellemont, 1986; WHO, 1998).

**Canada:** Permitted as a Traditional Herbal Medicine (THM) or homeopathic drug for oral use. Requires premarket authorization and assignment of a Drug Identification Number (DIN) if labeled as a THM or homeopathic drug (Health Canada, 1996). Food, if no claim statement is made.

**Council of Europe:** Dried flower, essential oil and fluid extract official in European Pharmacopoeia, 3rd edition (Ph.Eur., 2001).

**France:** Traditional Herbal Medicine (THM) for oral and external use for specific indications (Bradley, 1992; Bruneton, 1999). Official in the French Pharmacopoeia, 10th edition (Ph.Fr.X) (WHO, 1999).

**Germany:** Approved nonprescription drug of the German Commission E for oral and external use (Blumenthal et al., 1998). Tea infusion form is an approved nonprescription drug in the German Standard License monographs (Braun et al., 1996). The alcoholic fluid extract and the volatile oil forms are official in the German Pharmacopoeia (DAB, 1999).

**India:** Licensed single drug in Unani system of medicine (CCRUM, 1992). Also listed in compound formulations official in the National Formulary of Unani Medicine (NFUM I) with standards approved by the Unani Pharmacopoeia Committee (UPC) (NFUM, 1983).

**Italy:** Listed in the Italian Pharmacopoeia (Newall et al., 1996).

**Russian Federation:** Official in the USSR X (Bradley, 1992; Newall et al., 1996).

**Sweden:** Natural remedy for self-medication. Requires marketing authorization by the Medical Products Agency (WHO, 1998).

**Switzerland:** Official in the Swiss Pharmacopoeia (Ph.Helv.) (Wichtl, 1997). Creams, fluid extracts, powders, sprays, and tea infusions are Category D non-prescription drugs with sale limited to pharmacies and drugstores (Morant and Ruppanner, 2001; Asta Medica, 2000; WHO, 1998).

**U.K.:** Herbal medicine specified in the General Sale List, Schedule 1 (medicinal products requiring a full product license), Table A (internal or external use) (GSL, 1990).

**Clinical Review**

Ten studies are outlined in the following table, “Clinical Studies on German Chamomile,” including a total of 8,668 participants. All but one of the studies (Fidler et al., 1996) demonstrated positive effects for indications including dermatological, neurological, and respiratory conditions. Three studies (Fidler et al., 1996; Carl and Emrich, 1991; Nasemann, 1975) focused on the use of chamomile as a mouthwash for its astrigent and cooling effects, stomatitis, and mucositis (Fidler et al., 1996; Carl and Emrich, 1991; Nasemann, 1975). One stomatitis study did not
notice significant improvement (Fidler et al., 1996). Other dermatological studies included one controlled, bilateral, comparative study investigating a chamomile cream against inflammatory dermatoses (Aertgeerts et al., 1985), and a DB study on using a chamomile extract to promote wound-healing after dermabrasion (Glowania et al., 1987). Other studies demonstrating positive results included inhalation of the steam vapor of chamomile extract to treat respiratory tract conditions related to the common cold (Saller et al., 1990); inhalation of volatile oil to determine the effect of olfactory stimulation on mood (Roberts and Williams, 1992); and oral ingestion of the aqueous infusion to investigate cardiovascular effects after ventricular catheterization (Gould et al., 1973). In a study of 8,058 mothers in childbirth conducted over a period of eight years, two essential oils, clary sage (Salvia sclarea L.) and chamomile were shown to be effective in alleviating pain during labor (Burns et al., 2000). A recent DB, PC study investigated the use of a chamomile fluid extract and apple pectin combination product for treating young children with acute, non-complicated diarrhea (de la Motte et al., 1997).

**BRANDED PRODUCTS**

Diarrhoean® Chamomile fluidextract: Dr. Loges & Co. GmbH / Postfach 1262 / Schützenstrasse 5 / 21423 Winsen / Germany / Tel.: +49-041-71-7070 / Fax: +49-041-71-7071-00 / Email: info@loges.com. Each 100 ml of solution contains 2.5 ml of chamomile fluidextract (1:1), eluent: ethanol 55% and 3.2 g of apple pectin.

Kamillosan® Creme: VIATRIS GmbH & Co. KG / Weismüllerstrasse, 45 / D-60314 Frankfurt/Main / Germany / Tel: +49-69-4001 2811 / Fax: +49-69-4001 2951 / Email: info@viatris.com / www.viatris.com (formerly known as ASTA Medica AG). One gram cream contains 20 mg ethanolic dry extract (2.75:1) in a fatty ointment base. The extract contains no less than 0.2 mg volatile oil and a minimum of 0.07 mg (-)-abrol.

Kamillosan® Konzentrat: VIATRIS GmbH & Co. KG. Hydroalcoholic tincture extracted with 38.5% (m/m) ethanol; drug-to-extract ratio of approximately 1:4.0–4.5 (w/v), in 42.8% ethanol. Each 100 ml of tincture contains 150–300 mg essential oil; 150–300 mg apigenin-7-glucoside and 50 mg (-)-abrol.

Kamillosan® Liquidum: VIATRIS GmbH & Co. KG. Standardized hydroalcoholic fluid extract; 150 mg of essential oil per 100 ml fluid extract containing a minimum of 3 mg chamazulene and 50 mg (-)-abrol.

Kneipp® Kamillen-Konzentrat: Kneipp Werke /105-107 D-60314 Frankfurt / Germany / Tel.: +49-069-4001 2811 / Fax: +49-069-4001 2951 / Email: info@kneipp.com. One gram cream contains 20 mg ethanolic dry extract (2.75:1) in a fatty ointment base. The extract contains no less than 0.2 mg volatile oil and a minimum of 0.07 mg (-)-abrol.

American equivalents, if any, are found in the Product Table beginning on page 398.

<td>2 weeks</td>
<td>30 drops extract in 100 ml water as mouthwash 3x/day vs. placebo</td>
<td>Kamillosan® Konzentrat, diluted in water</td>
<td>Chamomile mouthwash administered in addition to cryotherapy did not significantly alleviate 5-fluouracil (5-FU)-induced stomatitis (p=0.32). However, subset analysis based on gender did reveal unexpected differential effects, suggesting that chamomile might be beneficial for males but detrimental for females. This could not be explained by reasons other than chance.</td>

<td>Carl and Emrich, 1991</td>
<td>Stomatitis and mucositis</td>
<td>U n=98</td>
<td>Varying durations for different treatment groups</td>
<td>Oral rinse during repeated cycles</td>
<td>Kamillosan® Liquidum</td>
<td>Chamomile oral rinse decreased stomatitis and was found to be beneficial in the treatment of mucositis resulting from radiation and cancer chemotherapeutic agents. The resolution of mucositis appeared to be accelerated by the chamomile rinse. Prophylactic oral care appeared to modify oral environment favorably and maintain tissue integrity.</td>

<td>Inflammatory dermatoses</td>
<td>Cn, Cm, MC n=161</td>
<td>3-4 weeks</td>
<td>Chamomile cream vs. 0.25% hydrocortisone, 0.75% fluocortin butyl ester, 5% bufexamac</td>
<td>Kamillosan® Crème</td>
<td>Chamomile cream showed more or less equally effective therapeutic results as hydrocortisone for treatment of inflammatory dermatoses. It proved superior to the nonsteroidal, anti-inflammatory agent 5% bufexamac as well as to 0.75% fluocortin butyl ester. For treatment of neurodermatitis, chamomile cream was therapeutically comparable to hydrocortisone and superior to other tested products.</td>
